Your physician has requested that you have a SenoBright* Contrast-Enhanced Spectral Mammography (CESM) exam.

The SenoBright exam is a simple, quick, five-to-ten-minute procedure that's much like a regular mammography exam. It is performed on the same GE Healthcare imaging system as standard mammography, in the same room and often with the same staff.

The difference is that, just before your exam, you will be injected with a small amount of an iodine contrast agent that will help bring out specific details your doctor is looking for in the images of your breasts. (Be sure to tell your doctor or an imaging center staff member if you've ever had an allergic reaction to iodine contrast).

After the injection, a two-minute waiting period is necessary to give the contrast time to flow. Then the images will be taken. The technologist will position you at the mammography system just like a regular mammogram. That's all there is to it.

Note: On the day of your exam, it is best to wear a two-piece outfit. It is also best not to wear lotions, powders, or deodorant as these can interfere with mammographic image quality. Therefore, you will be asked to remove them prior to your exam.
